Report generated with [pandas-profiling](#).

NULL VALUE IMPUTATION USING KNN IMPUTER

Each sample's missing values are imputed using the mean value from `n_neighbors` nearest neighbors found in the training set. Two samples are close if the features that neither is missing are close. By default, a euclidean distance metric that supports missing values, `nan_euclidean_distances`, is used to find the nearest neighbors

CODE FOR KNN IMPUTER

```
from sklearn.impute import KNNImputer
imputer = KNNImputer(n_neighbors=3)
df_filled = imputer.fit_transform(df1.select_dtypes(exclude="object"))
l=df1.select_dtypes(exclude="object").columns
df2=pd.DataFrame(df_filled,columns=l)
```

FEATURE HASHER

Implements **feature hashing**, aka the **hashing** trick. This class turns sequences of symbolic **feature** names (strings) into scipy. sparse matrices, using a **hash** function to compute the matrix column corresponding to a name. The **hash** function employed is the signed 32-bit version of Murmurhash3. It is used to reduce number of features.

```
from sklearn.feature_extraction import FeatureHasher
fh = FeatureHasher(n_features=10, input_type='string')
hashed_features = fh.fit_transform(df1['City'])
hashed_features = hashed_features.toarray()
hashed_features_state = fh.fit_transform(df1['State'])
hashed_features_state = hashed_features_state.toarray()
d=pd.concat([pd.DataFrame(hashed_features),pd.DataFrame(hashed_features_state)], axis=1)
```
